

## Chapter 10 — More CSS Selectors to Give Your Style Sheet Surgical Precision

In the style sheets we have created, so far, we have used the tag selector, the id selector, the class selector, the descendant combinator, and the :nth-child(n) pseudo class. In this chapter we will review those CSS selectors and show several of the most commonly used ones.

### ***Learning Outcomes for this Chapter***

Upon completion of the reading of this chapter and assignments found at the end, a student should be able to:

- Create CSS that includes the tag, id, and class selectors,
- use combinators to select elements within elements,
- use the universal selector to select all elements in a page or a combintor expression,
- create selection rules that use other attributes beyond id or class,
- use simple pseudo selectors.

### **Selectors**

A selector is used to tell the web browser to apply a style to an HTML element or group of elements. There are four selectors that we commonly use: 1) the universal selector; 2) the HTML tag selector; 3) the class selector; and 4) the id selector.

#### **The Universal Selector**

\* — everybody (the universal selector)<sup>108</sup>

Apply this CSS to every element on the page. It is commonly used with combinators, attribute selectors, and with pseudo classes that are to be applied to the entire page.

#### **The Tag Selector**

tag — all tags of a specific type<sup>109</sup>

108 <https://www.w3.org/TR/selectors-3/#universal-selector>  
109 <https://www.w3.org/TR/selectors-3/#type-selectors>

## The Class Selector

**.class** — class selector — apply the style to all the tags that have the same class defined as an attribute.<sup>110</sup>

On the HTML tag we define a class or classes using an attribute like: class="group" or class="first second"

You may specify multiple class names on a tag by separating them with a space.<sup>111</sup>

Class names are case sensitive and should start with a letter and contain letters, numbers, dashes, and underscores.<sup>112</sup>

## The ID Selector

**#id** — id selector — find the tag with the specified id attribute<sup>113</sup>

```
<!DOCTYPE html>
<html lang="en">
  <head>
    <meta charset="utf-8">
    <title>title</title>
    <link href="simple_selectors.css" rel="stylesheet" type="text/css">
  </head>
  <body>
    <h1>This page shows the simple CSS selectors at work.</h1>
    <section>
      <h2>Page section one</h2>
      <p class="happy">This is a paragraph that belongs to the happy class.</p>
    </section>
    <section>
      <h2 class="happy">Page section two</h2>
      <p>This is a paragraph that has <em id="cheese">Cheddar</em> on the side.</p>
    </section>
  </body>
</html>
```

This page shows the simple CSS selectors at work.

### Page section one

This is a paragraph that belongs to the happy class.

### Page section two

This is a paragraph that has Cheddar on the side.

*Illustration 31: Simple CSS Selectors*

## Cascading

<http://syw21.org>

In the example above you will notice that the "Page section two" heading has the "happy" background. This is because, if an element has more than one style that may apply the more specific style will be applied and may overwrite style from less specific styles.

## Combinators

A combinator allows for selectors to be combined to help zero in on a specific tag or group of tags. This introduction will cover five of the most common combinators.

### This and That Combinator

**selector\_one, selector\_two ...** (Comma) — apply the same style for multiple elements. It is really just a shortcut to keep from having the style repeated when it is used in

more than one place.<sup>114</sup>

## Descendant Combinator

`selector_one selector_two ...` (Space) — select all of selector\_two inside selector\_one. May be embedded anywhere within elements parent elements.<sup>115</sup>

## Adjacent Sibling Combinator

`selector_one + selector_two ...` (plus) — find the selector\_two directly after selector\_one at the same level. Siblings not children.<sup>116</sup>

## General Sibling Combinator

`selector_one ~ selector_two ...` (tilde) — find the selector\_two sibling(s) that follows selector\_one at the same level. The siblings do not have to be adjacent, just follow.<sup>117</sup>

## Direct Children Combinator

`selector_one > selector_two ...` (greater than) — select all selector\_two children inside selector\_one. This only gets direct children and not children of children.<sup>118</sup>

```

</section>
</section>
<section>
    <h2>Page section two</h2>
    <p>This is a paragraph that has <em id="cheese">Cheddar</em>
        on the side.</p>
</section>
<section>
    <h2>first one</h2>
    <h3>adjacent sibling</h3>
    <p>Paragraph with <b>two</b> heads.</p>
</section>

</body>
</html>
```

```
/* combinator.css - Sample CSS Sheet for Common Combinators */

/* this or that - apply to multiple selectors */
/* comma */
h1, em {
    font-family: script;
}

/* descendant - apply to selector within */
/* apply to all <b> tags in the class happy */
/* whitespace */
.bignews b {
    color: white;
    background-color: red;
}

/* adjacent sibling */
/* plus */
h2 + h3 {
    border-bottom: 5px solid black;
}

/* general sibling */
/* tilde */
h1 ~ section {
    border: 2px groove grey;
}

/* direct children */
/* greater than */
section > section {
```

```
border: 4px outset green;  
margin: 5px;  
}
```

*This page shows the CSS combinator at work.*

### **Page section one**

This is a paragraph that belongs to a **bignews** section.

**Inside section one**

Inside **paragraph**.

### **Page section two**

This is a paragraph that has *child*, on the side.

**first one**

**adjacent sibling**

Paragraph with **two heads**.

Illustration 32: CSS Combinators

## **Attribute Selectors**

Attribute selectors modify add additional refinement to the selectors above. They allow us to not only select items by tag, class, or id but also by attributes that the tag may have.<sup>119</sup> Follow a selector with a set of square braces. Inside the braces place an attribute name to test if the element has the attribute (with any value); or an expression to test the specific value of the attribute.

**selector[attribute]** — Select if the element has the attribute.

**selector[attribute=value]** — Select if the element has the attribute with a specific value.

<sup>119</sup> <https://www.w3.org/TR/selectors-3/#attribute-selectors>

**selector[attribute\*=value]** — Select if the element has the value one or more times anywhere in the attribute.

There are more attribute selectors, that allow for more complex selection rules, but these are common. For more information follow the links in the footnotes to this section.

```
<!DOCTYPE html>
<html lang="en">
  <head>
    <meta charset="utf-8">
    <title>Attribute Selector</title>
    <link href="attribute_selector.css" rel="stylesheet" type="text/css">
  </head>
  <body>
    <h1>Attribute Selector</h1>
    <ul>
      <li><label for="username">Name:</label>
          <input type="text" name="username" required>
        </li>
      <li><label for="color">Favorite Color:</label>
          <select name="color" id="color_select" required>
            <option value="R">Red</option>
            <option value="O">Orange</option>
            <option value="Y">Yellow</option>
            <option value="G">Green</option>
            <option value="B">Blue</option>
            <option value="I">Indigo</option>
            <option value="V">Violet</option>
            <option value="X">Do Not Wish to Answer</option>
          </select>
        </li>
      <li><label for="Comment">Comment:</label>
          <textarea name="comment"></textarea>
        </li>
    </ul>
  </body>
</html>
```

```
/* attribute_selector.css - Sample CSS Sheet for Attribute Selectors */

ul {
  list-style: none;
}

label {
  display: inline-block;
```

```
        width: 10em;  
    }  
  
    /* put a bold border around required fields */  
    *[required] {  
        border: 5px groove black;  
    }  
  
    option[value="R"] {  
        color: red;  
    }  
  
    option[value="O"] {  
        color: orange;  
    }
```

## Attribute Selector

Name:  
Favorite Color:  
Comment:

*Illustration 33: Attribute Selector*

## Pseudo-classes

Pseudo means false.<sup>120</sup> These special selectors are typically added to the end of a simple selector (class, id, tag, or universal) to create special behavior.<sup>121</sup> As an example, we can change the style of an element based on whether the mouse pointer is hovering over an element.

120 <http://dictionary.reference.com/browse/pseudo>

121 <https://developer.mozilla.org/en-US/docs/Web/CSS/Pseudo-classes>

- `:hover`<sup>122</sup> — apply this style to the element when the mouse pointer is over the element.
- `:link`<sup>123</sup> — for anchors (`<a>`) apply this style if it is a clickable link.
- `:visited` — for anchors (`<a>`) apply this style if we have visited the link.
- `:nth-child(n)`<sup>124</sup> — one of many of the "Structural Pseudos" but very common.  
Usually used for pretty table and list formatting. This was seen in the previous chapter on tables.
- `:checked`<sup>125</sup> — apply this style when the element is checked
- `selector_1:not(selector_2)`<sup>126</sup> — Negation — selector\_1 but not selector\_2.  
The selector in the not expression must be a simple selector

## Advanced Topics for Exploration

We did not cover all of "The 30 CSS Selectors you Must Memorize" by Jeffery Way<sup>127</sup> as we could have but...

CSS name spaces.

## Vocabulary

Please support this work at  
<http://syw21.org>

- adjacent sibling selector
- attribute selector
- checked
- class selector
- combinator
- descendant combinator
- direct children combinator
- general sibling combinator
- hover
- id selector
- link
- not
- nth-child
- pseudo class
- tag selector
- this and that combinator
